Received 16 December 2020; accepted 22 January 2021

This paper investigates exact voyaging (2 + 1) dimensional Heisenberg ferromagnetic spin chain solutions with conformable fractional derivatives, an important family of nonlinear equations from Schrödinger (NLSE) for the construction of hyperbolic, trigonometric and complex function solutions. The detailed rational sine-cosine system and rational sinh-cosh system were used to locate dim, special and periodic wave solutions successfully. These findings suggest that the proposed approaches may be useful to investigate a range of solutions inside a repository of applied sciences and engineering, with success, quality, and trust. In addition, graphical representations and physical expresses of such solutions are represented by a set of the required values of the parameters involved. The methods are essentially adequate and can be extended to different dynamic models that create the nonlinear processes in today’s research.

Keywords: Heisenberg ferromagnetic spin chain; conformable fraction derivative; extended rational trigonometric method; exact solutions.

1. Introduction

Over the last few years, nonlinear Schrödinger’s equations (NLSEs) have attracted much attention in the field of research due to their numerous fascinating behaviour and countless characteristics. A large variety of these equations are utilized to describe important phenomena in different scientific fields like, plasma physics [1,2], condensed matter physics [3], convective fluids [5], optical fibers [6,7], solid state physics [8,9], hydrodynamic [10], water waves [11] and many other branches of engineering [12-14]. In past years, to find the exact solutions of NLSEs many powerful technique have been developed such as, the inverse scattering transformation [15], the homotopy perturbation method [16,17], the Darboux transformation method [18,19], the Sine-Gordon expansion method [20], Bernoulli sub-equation method [21], the modified auxiliary equation mapping method [22,23], the Riccati equation mapping method [4], the extended sinh-Gordon equation expansion method [24], the modify extended direct algebraic method [25].

The Heisenberg models of ferromagnetic spin chains with various magnetic reactions in the classical and semiclassical limits have been related with nonlinear evaluation equations (NLEEs). The nonlinear spin chain have wide range of applications in magnetic materials such as, sensors [26], microwave, date storage devices, communication system [27], signal processing devices and quantum computing. In this article, we have successfully investigated a variety of exact travelling wave solutions by employing extended rational trigonometric methods to construct the hyperbolic, trigonometric and complex function solutions moreover classify as dark, singular and periodic wave solutions. To study (2+1)-dimensional Heisenberg ferromagnetic spin chains (HFSC) model of the form [28,29].

\[ i \Psi_t + \mu \Psi_{xx} + \lambda \Psi_{yy} + \eta \Psi_{xy} - \delta |\Psi|^2 \Psi = 0, \quad (1) \]

here, \( \Psi \) is coherent amplitude. Hashemi transform it into fractional form:

\[ i D_\alpha^\mu (\Psi) + \mu \Psi_{xx} + \lambda \Psi_{yy} + \eta \Psi_{xy} - \delta |\Psi|^2 \Psi = 0, \quad (2) \]

where \( \Psi = \Psi(x, y, t) \) is the complex valued function of Heisenberg ferromagnetic spin chain, \( x \) and \( y \) are representing scaled spatial and \( t \) is the time coordinates respectively.

In recent times, a large number of scientists and researchers have been attracted to HFSC models due to their significant and fascinating characteristics for construction of different types of exact solutions in NPDEs. \( D_\alpha^\mu (\Psi) \) is the conformable fraction derivative of \( \Psi \) of order \( \alpha \). Nowadays, the field of conformable fractional derivative become one of the most important and interesting field for scientists because...
of its uses nonlinear sciences such as, fluid mechanics, chemical and biological processes. In literature, there are so many definitions which of them are, Riemann-Liouville [30,31], Atangana-Baleanu derivative in Caputo sense [32], Caputoa and Grunwald-Letnikov [33-35].

The remaining paper is arranged as fellows: In Sec. 2 some sliton solutions to the HFSC model have been presented. The physical significance and graphical representation is presented in Sec. 3. In Sec. 4 finally the concluding remarks and behaviour of solution have been discussed.

2. Mathematical analysis

In this section, to obtain the exact solutions of Eq. (2) by applying following conformable fractional derivative [36]
\[ D^\alpha_s (\Psi(t)) = \lim_{\epsilon \to 0} \frac{\Psi(t + \epsilon^{1-\alpha}) - \Psi(t)}{\epsilon}. \]  
(3)

By this definition and following complex travelling wave transformation
\[ \Phi(x, y, t) = \Psi(s)e^{i\Theta(x,y,t)}, \]  
(4)

where
\[ s = \alpha_1 x + \alpha_2 y - \frac{\nu\omega}{\alpha}, \]
\[ \Theta = -\beta_1 x - \beta_2 y + \rho \frac{\omega}{\alpha} + \theta. \]  
(5)

\[ \Phi_1,1(x, y, t) = \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \frac{\sin \left( \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}(s) \right)} {1 + \cos \left( \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}(s) \right)} \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega}{\alpha} + \theta)}. \]  
(9)

\[ \Phi_1,2(x, y, t) = -\sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \frac{\sin \left( \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}(s) \right)} {1 + \cos \left( \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}(s) \right)} \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega}{\alpha} + \theta)}. \]  
(10)

Putting Eq. (5) into Eq. (2), we obtain
\[ (\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)\Psi''(s) - (\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)\Psi(s) - \delta \Psi(s)^3 = 0, \]  
(6)

where \( \alpha_1, \alpha_2, \beta_1 \) and \( \beta_2 \) real constants and are center of phase. where \( \Theta \) represents the phase component, \( \rho \) is the velocity and \( \omega \) is the frequency respectively.

2.1. Applications of the extended rational sine-cosine method

Assume that Eq. (6) has the solution of the form:
\[ \Psi(s) = \frac{A_0 \sin (\nu s)}{A_2 + A_1 \cos (\nu s)}, \cos (\nu s) \neq -\frac{A_2}{A_1}, \]  
(7)

or of the form
\[ \Psi(s) = \frac{A_0 \cos (\nu s)}{A_2 + A_1 \sin (\nu s)}, \sin (\nu s) \neq \frac{A_2}{A_1}, \]  
(8)

where \( A_0, A_1 \) and \( A_2 \) are parameters that will be determined and \( \nu \) represents wave number.
Provided that

\[ y = \frac{\mu \beta^2}{\delta} + \eta \beta_1 \beta_2 + \lambda \beta_2^2 \]  

\[ \Phi(11) \]

\[ \Phi(12) \]

\[ \Phi(13) \]

\[ \Phi(14) \]

Case II:

\[ A_0 = \pm A_1 \sqrt{\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \]  

\[ A_2 = 0, \quad \nu = \pm \sqrt{\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} / (2 \mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) \].

Again, substituting these results into Eq. (5) by using Eq. (7), we obtain

\[ \Phi(15) \]

\[ \Phi(16) \]

provided that \((\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) > 0\).

Family II

Again, substituting Eq. (8) into Eq. (6) and then setting each coefficients of all terms of \(\sin^m(\nu s)\) or \(\cos^m(\nu s)\) to zero, yields a system of algebraic equations. Then we obtain system of algebraic equations involving parameters \(A_0, A_1, A_2, \mu, \nu, \lambda, \delta, \rho\).

\[ -\delta A_0^2 + A_1^2 (\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0, \]

\[ A_1 A_2 [-\nu^2 \alpha_1^2 - \eta \nu^2 \alpha_1 \alpha_2 - \lambda \nu^2 \alpha_2^2 + 2(\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)] = 0, \]

\[ \delta A_0^2 - 2 \nu^2 A_2^2 (\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) + A_2^2 (\rho + \mu \nu^2 \alpha_1^2 + \eta \nu^2 \alpha_1 \alpha_2 + \lambda \nu^2 \alpha_2^2 + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0. \]

This system, gives the following set of solutions:

Case I:

\[ A_0 = \pm A_1 \sqrt{\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}, \quad A_1 = \pm A_2, \quad \nu = \pm \sqrt{2(\rho + \mu \beta^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) / (\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)}. \]

Substituting these results into Eq. (5) by using Eq. (8), we have

\[ \Phi(17) \]
\( \Phi_{2,2}(x, y, t) = -\sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \left( \cos \left[ \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega_m}{\omega} + \theta)} \). (16)

\( \Phi_{2,3}(x, y, t) = \sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \left( \cos \left[ \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega_m}{\omega} + \theta)} \). (17)

\( \Phi_{2,4}(x, y, t) = -\sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \left( \cos \left[ \frac{2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega_m}{\omega} + \theta)} \). (18)

Case II:

\( A_0 = \pm A_1 \sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \), \quad A_2 = 0, \quad \nu = \pm \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)}}.

Again, substituting these results into Eq. (5) by using Eq. (8), we obtain

\( \Phi_{2,5}(x, y, t) = \sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \left( \cot \left[ \frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)} \right] \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega_m}{\omega} + \theta)} \). (19)

\( \Phi_{2,6}(x, y, t) = -\sqrt{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2} \left( \cot \left[ \frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)} \right] \right) e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\omega_m}{\omega} + \theta)} \), (20)

provided that \((\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) > 0\).

### 2.2. Applications to the extended rational sinh-cosh method

Assume that Eq. (6) has the solution of the form:

\[ \Psi(s) = \frac{A_0 \sinh(\nu s)}{A_2 + A_1 \cosh(\nu s)}, \quad \cosh(\nu s) \neq -\frac{A_2}{A_1}, \] (21)

or of the form

\[ \Psi(s) = \frac{A_0 \cosh(\nu s)}{A_2 + A_1 \sinh(\nu s)}, \quad \sinh(\nu s) \neq -\frac{A_2}{A_1}, \] (22)

where \(A_0, A_1\) and \(A_2\) are parameters that will be determined and \(\nu\) represents wave number.

**Family I**

Now, substituting Eq. (21) into Eq. (6) and then setting each coefficients of all terms of \(\cosh^{(m)}(\nu s)\) or \(\sinh^{(m)}(\nu s)\) to zero, yields a system of algebraic equations. Then we obtain system of algebraic equations involving parameters \(A_0, A_1, A_2, \mu, \nu, \lambda, \delta, \rho\). This system of equations are solved as follows:

\[ \delta A_0^2 + A_1^2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0, \]

\[ A_1 A_2[\mu \nu^2 \alpha_1^2 + \eta \nu^2 \alpha_1 \alpha_2 + \lambda \nu^2 \alpha_2^2 + 2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)] = 0, \]

\[ -\delta A_0^2 + 2\nu^2 A_1^2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) + A_2^2(\rho - \mu \nu^2 \alpha_1^2 - \eta \nu^2 \alpha_1 \alpha_2 - \lambda \nu^2 \alpha_2^2 + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0. \]
Solving this system, we yields the following set of solutions with help of Mathematica:

Case I:

\[ A_0 = \pm i A_1 \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}}, \quad A_1 = \pm A_2, \quad \nu = \pm \sqrt{\frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}}. \]

Substituting these results into Eq. (5) by using Eq. (21), we have

\[ \Phi_{3.1}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}. \]

\[ \Phi_{3.2}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}. \]

\[ \Phi_{3.3}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}. \]

\[ \Phi_{3.4}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}. \]

Case II:

\[ A_2 = 0, \quad \nu = \pm \sqrt{\frac{-(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)}}. \]

Again, substituting these results for only the positive values into Eq. (21), we obtain

\[ \Phi_{3.5}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \tanh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}, \]

\[ \Phi_{3.6}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \tanh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) \right] \right) \times e^{i(-\beta_1 x - \beta_2 y + \rho \frac{\beta_2}{\beta_1} + \theta)}, \]

holds for \((\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) < 0.\)
Family II

Again, substituting Eq. (22) into Eq. (6) and then setting each coefficient of all terms of $\sinh^m(\nu s)$ or $\cosh^m(\nu s)$ to zero, yields a system of algebraic equations. Then we obtain system of algebraic equations involving parameters $A_0, A_1, A_2, \mu, \nu, \lambda, \delta, \rho$.

$$
\delta A_0^2 + A_1^2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0,
$$

$$
A_1 A_2[\mu \nu^2 \alpha_1^2 + \eta \nu^2 \alpha_1 \alpha_2 + \lambda \nu^2 \alpha_2^2 + 2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)] = 0,
$$

$$
\delta A_0^2 - 2\nu^2 A_1^2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) + A_2^2(\rho - \mu \nu^2 \alpha_1^2 - \eta \nu^2 \alpha_1 \alpha_2 - \lambda \nu^2 \alpha_2^2 + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2) = 0.
$$

This system, gives the following set of solutions:

Case I:

$$
A_0 = \pm i A_1 \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}}, \quad A_1 = \pm A_2, \quad \nu = \pm \sqrt{\frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2}}.
$$

Substituting these results into Eq. (5) by using Eq. (22), we obtain

$$
\Phi_{4,1}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \begin{array}{c} \cosh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \\ 1 + \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \end{array} \right) \times e^{i(-\beta_1 x - \beta_2 y + \frac{\eta \alpha_1 \alpha_2}{\mu \alpha_1^2} + \theta)}.
$$

(29)

$$
\Phi_{4,2}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \begin{array}{c} \cosh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \\ 1 + \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \end{array} \right) \times e^{i(-\beta_1 x - \beta_2 y + \frac{\eta \alpha_1 \alpha_2}{\mu \alpha_1^2} + \theta)}.
$$

(30)

$$
\Phi_{4,3}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \begin{array}{c} \cosh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \\ 1 - \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \end{array} \right) \times e^{i(-\beta_1 x - \beta_2 y + \frac{\eta \alpha_1 \alpha_2}{\mu \alpha_1^2} + \theta)}.
$$

(31)

$$
\Phi_{4,4}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \left( \begin{array}{c} \cosh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \\ 1 - \sinh \left[ \frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2} \right](s) \end{array} \right) \times e^{i(-\beta_1 x - \beta_2 y + \frac{\eta \alpha_1 \alpha_2}{\mu \alpha_1^2} + \theta)}.
$$

(32)

Case-II:

$$
A_0 = \pm i A_1 \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}}, \quad A_2 = 0, \quad \nu = \pm \sqrt{\frac{-2(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)}}.
$$
Again, substituting these results into Eq. (5) by using Eq. (22), we obtain

\[ \Phi_{4,5}(x, y, t) = i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \begin{pmatrix} \coth \left( \frac{-(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)} \right) \end{pmatrix} e^{\{\beta_1 x - \beta_2 y + \rho \omega_t + \theta\}}. \]

(33)

\[ \Phi_{4,5}(x, y, t) = -i \sqrt{\frac{\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2}{\delta}} \begin{pmatrix} \coth \left( \frac{-(\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)}{2(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2)} \right) \end{pmatrix} e^{\{\beta_1 x - \beta_2 y + \rho \omega_t + \theta\}}, \]

(34)

provided that \((\rho + \mu \beta_1^2 + \eta \beta_1 \beta_2 + \lambda \beta_2^2)(\mu \alpha_1^2 + \eta \alpha_1 \alpha_2 + \lambda \alpha_2^2) > 0.\)

3. Physical significance and graphical representations

In this section, we construct the physical interpretation to the some problem of the paper that add extra flavour to our analytical solutions of (2). For this purpose, graphical representations of some established problem are discussed and suitable choice of help us to construct dark, singular and traveling wave solutions. The graphically representations of some obtained solutions in two and three-dimensional are given from Figs. 1 to 7. Figure 1 for Eq. (13) and Fig. (2) for Eq. (19) represent periodic wave solutions and two-dimensional graphics limit cycle with suitable choice of parameters. Figure 5 for Eq. (27) and Fig. 7 for Eq. (33) show dark and singular wave solutions. Dark and singular wave solutions types presents in Figs. 3, 4 for Eq. (23) and Fig. 6 for Eq. (29).

**FIGURE 1.** a) 3D and b) 2D surfaces for the \(|\Phi_{1,5}(x, y, t)|\) with \(-1 \leq x, t \leq 1\) for the values \(\mu = 1, \eta = 2.50, \lambda = 2.50, \delta = 1.50, \alpha = 1, \alpha_1 = -1, \alpha_2 = 1, \beta_1 = 2, \beta_2 = 1, \theta = 0, \rho = 0, \omega = 1, y = 0\) and their projections at \(t = 1, 1.25, 1.50\).

4. Concluding remarks

In our work, we have employed suitable technique to develop some new travelling wave solutions to the special kind of nonlinear Schrödinger’s equations. The extended rational sine-cosine method and extended rational sinh-cosh method are found to be as one of the most effective, accurate and powerful tools for the construction of analytical solutions for fractional HFSCs in the semi-classical limit. As a result, obtained some new exact solution in the form of hyperbolic, trigonometric and complex functions solutions. On the basis of our results, we found that solutions presented in [37-39] using different models these solutions will be useful in future development in order to construct exact solutions, the existence criteria of involving parameters are also discussed. Moreover, some of exact solutions obtained by these methods are mostly identical. We can conclude that the proposed method is one of the most proficient techniques and can be efficiently employed for further investigation to NPDEs raising in contemporary science.
